

Crank-up lift system

How to disassemble torsion bar from camper roof

1. Raise roof to upright position (roof must be in full up position)
2. Block up or support roof so it can not fall down
3. Remove 3/8 x 3 rear roof support center pivot bolt
4. Remove 3/8 x 3 front roof support center pivot bolt.
5. Remove small set screw at the top of both roof supports
6. Have second person pull towards the middle of the camper on the rear roof support while the person in the front of the camper removes the lower bolt on the front roof support. (By pulling in on the rear roof support it will take the tension off the front roof support making it easier to take the lower bolt out)
7. Slide front & rear roof supports down to disassemble from torsion bar legs.
8. Remove front bolt on torsion bar pivot to drop torsion bar assembly down and slide assembly foreword to disassemble it from the anchor in the back of the roof.
9. Now you can replace torsion bar or rear anchor on that side.
10. When reassembling torsion bar to rear anchor, make sure that when the hexes in the torsion bar assembly align with the back anchor, the legs coming down on the torsion bar assembly **are** pointing towards the outside of the camper not towards the middle of the camper.
11. Reverse procedure starting with #8 to reassemble the rest of the lift system.

See exploded view of lift system assembly attached with these instructions.
